Work Reference Letter

I am pleased to write this reference for Mr. Yashar Mahmood Lashkar, who has been working with me since November 2023 as a Student Assistant at the Chair of Factory Planning and Intralogistics. His work has been part-time alongside his studies, ranging between 40 and 80 hours per month, and he continues to be an integral member of our team. His contract will be ending in November 2026, when the funding of the research project ends.

Yashar has played a central role in the KMI (Künstlich Menschlich Intelligent) research project, which is funded under the German Federal Ministry of Education and Research's program "Innovationen für die Produktion, Dienstleistung und Arbeit von morgen". Within this project, he was one of the main contributors to the development of the demonstrator AI Driver, which interacts with a genetic algorithm and gives users an overview of the impact of data quality in the context of AI training. The work was carried out by a three-person student team and was largely self-organized by the students. In this team, Yashar took responsibility for guiding and managing the Unity side of the programming tasks and provided the technical foundation on which major parts of the demonstrator were built.

His contributions included the development of the base game in Unity, consisting of a racetrack and a functional car controller for human driving. Building on this foundation, he created a second game mode in which self-driving agents are spawned and guided by the results of a genetic algorithm. He also implemented the relevant controllers and user interface elements, designed the user interface, and created result visualization diagrams that allow users to interact with and better understand the output of the system. Toward the end of the project, he additionally supported the implementation of the genetic algorithm in Python. His work required fluency in Unity, C#, Python, Git, genetic algorithm integration, PostgreSQL, and MySQL, and he consistently delivered reliable, well-structured, and practically usable solutions.

What made Yashar's contribution especially valuable was not only his technical implementation work, but also his ability to structure complex development tasks and turn abstract re-

search ideas into an interactive and understandable demonstrator. He created the basis for the three-student team's work, contributed many useful ideas for solving technical and conceptual problems, and helped ensure that the final system was coherent from both a software and user perspective. His work significantly advanced the project and formed an essential part of the demonstrator's functionality.

Beyond his technical achievements, Yashar is an independent, structured, creative, and solution-oriented individual. He approaches problems proactively, learns quickly, and communicates well within a team. Even when dealing with complex technical challenges, he remains focused, reliable, and constructive. His work demonstrates a strong understanding of project goals, a high degree of technical ability, and the capacity to take responsibility for substantial parts of a research-oriented software project.

It has been a pleasure working with Yashar, and I have full confidence in his ability to excel in any future professional or academic endeavor he chooses to pursue. I strongly recommend him to any organization seeking a skilled, creative, dependable, and proactive contributor with strong software development capabilities and the ability to translate complex ideas into working technical solutions.

Sincerely

Hendrik Unger
